Why you should pick the GNU General Public License versus the GNU Free Documentation License

First, let's look at what each of these licenses are. The GNU General Public License is a software license that ensures that software under this license is free to distribute, use, and modify for all the users of the software ("The GNU General Public License V3.0 - GNU Project - Free Software Foundation"). Another major feature of this license includes it being a copyleft license, meaning that derivative works must use the same license. Derivative works is software derived from the software under this license. Developers who use this license therefore must provide the source code for any software under this license. The GNU Free Documentation License is another license designed to provide free distribution, use and modification for documentation, such as manuals, textbooks, and any other written content ("GNU Free Documentation License V1.3 - GNU Project - Free Software Foundation"). Major features of this license include the ability as the author of the work to make sections of the work invariant. This means that those sections cannot be modified by the user of the document. Documentation under this license is also DRM (Digital Rights Management) controlled. This means that use cases for the content under the GNU Free documentation license that control the rights to copying and reading are not allowed. In conclusion, the GNU General Public License is best used if you want to provide free open-source software, while the GNU Free Documentation license is recommended for providing free open-source documentation.
